

Living crystals

Better Tomorrow

DETERIORATION OF WATER'S CRYSTALLINE STRUCTURE MEANS
DETERIORATION OF LIQUID CRYSTALLINE MAKE-UP OF THE BODY

We are living crystals. Leading edge science reveals that our bodies are a network of interconnected, fluid, crystalline structures. Collagen, elastin, and other components of connective tissue are literally liquid crystals. Crystals are transducers. They are capable of converting one form of energy into another. For example: quartz crystals convert vibrational energy into electrical energy; they can convert light energy into vibrational signals. The crystalline nature of our bodies also makes it possible for the transmission of this information at the speed of light. Signals cannot be efficiently conducted through a maze, but when there is organization in the medium; signals follow clear channels and arrive in a timely manner without distortion. In our bodies, it is the crystalline molecular structure of fluids that permits clear, crisp signaling and information transfer.

Structured water is an integral part of the liquid crystalline make-up of the body. It connects, supports, and helps create crystallinity in the tissues. And when water's crystalline structure deteriorates (with age and disease) the whole system is compromised. Ultimately, disorganization equals death.

Quantum physicists have concluded again and again, that the difference between life and death is found in the organization of the system. The greater the degree of organization, the greater the degree of life energy, and the slower the system deteriorates. In essence, life is not about which atoms and molecules are present or in what concentrations, life is about the degree to which those molecules are organized. As soon as crystalline-like order takes place, life is born; and the greater the number of crystalline components that are gathered together to function as a whole, the more complex the life form.

Is the liquid crystal known as hexagonal (structured) water alive?

So, what about water? Is the liquid crystal known as hexagonal (structured) water alive? Many of us are familiar with the term "living water." In some circles that term may have a spiritual connotation, but in scientific terms, "living water" simply refers to its crystalline structure. In many ways water is alive. Water responds to every energetic stimulus. Dr. Emoto's work even documents that water responds to the energy of our thoughts - with variations in the intricacy of its snowflake-like patterns.

Additionally, the degree to which water is organized influences its life-giving properties - especially within the human body. Multitudes of tests now verify that drinking hexagonal water improves, hydration, overall energy, mental clarity, and a host of symptoms related with those factors.
